

Case Study

Capability:	Pipework Fabrication & Installation
Client:	Confidential
Location:	Milford Haven
Project:	Berth 2 Rationalisation & Header Manifold
Contract:	Design, build & associated works

Description

A local oil terminal required work to be carried out at marine loading facility Berth 2 to rationalise the over water pipe-track. The works included removal of redundant lines & the uprating of the remaining in-service lines from the jetty head gate to the root of the berth. Additionally, the client required an upgrade of the jetty head manifolds. The works consisted of fabrication, test & installation before final test & hand-over. This work required a staged approach to allow installation of the different uprated manifold sections whilst minimising berth disruption.
